Space 3.2.6 Patch Notes

Brief description of the patch

This patch provides a fix for the behaviour exhibited in INTS-234. It does so by extending the lucene query for the recent activities list to exclude items with the deleted aspect applied by the Managed Deletion feature. It also patches INTS-236 where no avatar was rendered in Space notification windows for group chat messages by presenting the avatar of a user from the group chat.

Before the patch

Run a full system backup.

Installation Instructions

The following instructions assume that the relevant patch file has been copied into `/tmp/space-3.2.6-patch.zip` on each backend server. We assume the patch is executed as `root`. We assume that the on-site `integration.properties` file is stored in `/opt/`.

1. Smoke test the existing system to gain confidence it is performing normally.

2. Unzip the supplied patch on all backed boxes: `cd /tmp/ && unzip space-3.2.6-patch.zip`

3. Run the patch for each backend box:

   ```
   cd /tmp/space-3.2.6-patch && sh patch_alfresco.sh
   /opt/integration.properties
   ```

After the Patch

1. Stop and start the alfresco service.
2. Smoke test the system to gain confidence it is performing normally, paying particular attention to the recent activities dashlet and group chat notifications in Space.
